Continuous-Time Ratiometric Linear Hall-Effect Sensor ICs

Last Time Buy

These parts are in production but has been determined to be LAST TIME BUY. This classification indicates that the product is obsolete and notice has been given. Sale of this device is currently restricted to existing customer applications. The device should not be purchased for new design applications because of obsolescence in the near future. Samples are no longer available.

Date of status change: December 5, 2016

Deadline for receipt of LAST TIME BUY orders: August 30, 2017

Recommended Substitutions: A1308

For existing customer transition, and for new customers or new applications, contact Allegro Sales.

NOTE: For detailed information on purchasing options, contact your local Allegro field applications engineer or sales representative.

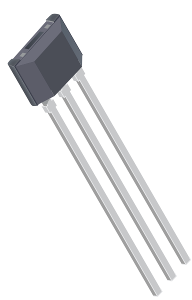
Continuous-Time Ratiometric Linear Hall Effect Sensor ICs

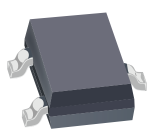
FEATURES AND BENEFITS

- Low-noise output
- Fast power-on time
- Ratiometric rail-to-rail output
- 4.5 to 6.0 V operation
- Solid-state reliability
- Factory-programmed at end-of-line for optimum performance
- Robust ESD performance

Packages:

3-Pin SOT23W (suffix LH) **3-Pin SIP (suffix UA)**





Not to scale

DESCRIPTION

The A1301 and A1302 are continuous-time, ratiometric, linear Hall-effect sensor ICs. They are optimized to accurately provide a voltage output that is proportional to an applied magnetic field. These devices have a quiescent output voltage that is 50% of the supply voltage. Two output sensitivity options are provided: 2.5 mV/G typical for the A1301, and 1.3 mV/G typical for the A1302.

The Hall-effect integrated circuit included in each device includes a Hall circuit, a linear amplifier, and a CMOS Class A output structure. Integrating the Hall circuit and the amplifier on a single chip minimizes many of the problems normally associated with low voltage level analog signals.

High precision in output levels is obtained by internal gain and offset trim adjustments made at end-of-line during the manufacturing process.

These features make the A1301 and A1302 ideal for use in position sensing systems, for both linear target motion and rotational target motion. They are well-suited for industrial applications over extended temperature ranges, from –40°C to 125°C.

Two device package types are available: LH, a 3-pin SOT23W type for surface mount, and UA, a 3-pin ultramini SIP for through-hole mount. They are lead (Pb) free (suffix, –*T*) with 100% matte tin plated leadframes.

CHARACTERISTIC DEFINITIONS

Quiescent Output Voltage

In the quiescent state (no significant magnetic field: B = 0), the output, V_{OUTQ}, equals one half of the supply voltage, V_{CC}, throughout the entire operating ranges of V_{CC} and ambient temperature, T_A. Due to internal component tolerances and thermal considerations, there is a tolerance on the quiescent output voltage, ΔV_{OUTQ}, which is a function of both ΔV_{CC} and ΔT_A. For purposes of specification, the quiescent output voltage as a function of temperature, $\Delta V_{OUTQ(\Delta T_A)}$, is defined as:

$$\Delta V_{OUTQ(\Delta T_A)} = \frac{V_{OUTQ(T_A)} - V_{OUTQ(25°C)}}{Sens_{(25°C)}} \tag{1}$$

where Sens is in mV/G, and the result is the device equivalent accuracy, in gauss (G), applicable over the entire operating temperature range.

Sensitivity

The presence of a south-polarity (+B) magnetic field, perpendicular to the branded face of the device package, increases the output voltage, V_{OUT}, in proportion to the magnetic field applied, from V_{OUTQ} toward the V_{CC} rail. Conversely, the application of a north polarity (–B) magnetic field, in the same orientation, proportionally decreases the output voltage from its quiescent value. This proportionality is specified as the magnetic sensitivity of the device and is defined as:

$$Sens = \frac{V_{OUT(-B)} - V_{OUT(+B)}}{2B} \tag{2}$$

The stability of the device magnetic sensitivity as a function of ambient temperature, $\Delta Sens_{(\Delta T_A)}$ (%) is defined as:

$$\Delta Sens_{(\Delta T_A)} = \frac{Sens_{(T_A)} - Sens_{(25°C)}}{Sens_{(25°C)}} \times 100\% \tag{3}$$

Ratiometric

The A1301 and A1302 feature a ratiometric output. This means that the quiescent voltage output, V_{OUTQ}, and the magnetic sensitivity, Sens, are proportional to the supply voltage, V_{CC}.

The ratiometric change (%) in the quiescent voltage output is defined as:

$$\Delta V_{OUTQ(\Delta V)} = \frac{V_{OUTQ(V_{CC})} / V_{OUTQ(5V)}}{V_{CC} / 5\text{ V}} \times 100\% \tag{4}$$

and the ratiometric change (%) in sensitivity is defined as:

$$\Delta Sens_{(\Delta V)} = \frac{Sens_{(V_{CC})} / Sens_{(5V)}}{V_{CC} / 5\text{ V}} \times 100\% \tag{5}$$

Linearity and Symmetry

The on-chip output stage is designed to provide linear output at a supply voltage of 5 V. Although the application of very high magnetic fields does not damage these devices, it does force their output into a nonlinear region. Linearity in percent is measured and defined as:

$$Lin+ = \frac{V_{OUT(+B)} - V_{OUTQ}}{2\,(V_{OUT(+B½)} - V_{VOUTQ})} \times 100\% \tag{6}$$

$$Lin- = \frac{V_{OUT(-B)} - V_{OUTQ}}{2(V_{OUT(-B½)} - V_{OUTQ})} \times 100\% \tag{7}$$

and output symmetry as:

$$Sym = \frac{V_{OUT(+B)} - V_{OUTQ}}{V_{OUTQ} - V_{OUT(-B)}} \times 100\% \tag{8}$$
